## **HS720AM • HS720AA • HS720AS HANDLEBAR TIGHTENING TORQUE**

During initial setup, tighten the two handlebar attaching 8 mm flange nuts to 52 in-lb (5.9 N•m) using a torque wrench. This torque is achieved by tightening the flange nuts approximately 1/4 turn after the bolt free-play is eliminated. **Do not over-tighten the nuts.** Over-tightening these nuts will cause excessive vibration to be transferred to the upper handlebar.

(AA type shown)
